## **OBJECTIVES AND EXPECTED RESULTS**

The GreenAuto Agenda aims to position the national automotive industry in the value chain of low-emission vehicles. To achieve this goal, the Agenda proposes the development of innovative, digital and sustainable products and processes associated with the manufacture of automobiles and their components.

Dalphi's participation consists in creating industrial capabilities to manufacture new car steering wheels (PPS 6), incorporating new Human-Machine Interface (HMI) functionalities. PPS 6 aims to create the HMI functionalities of the future, capable of supporting Advanced Driver Assistance Systems (ADAS), while at the same time contributing to the functional and seamless enrichment of the steering wheel (e.g. new control functions in the steering wheel, incorporation of hands-on-detection, ability to monitor the driver's condition).
